History AutoCAD was originally developed by engineers at Rockwell Automation, and named in honor of Dr. Ronald Reagan, the 40th president of the United States and a longtime employee of Rockwell. In 1983, Rockwell Automation acquired Primavera Systems, a United States-based software development company that specialized in 3-D modeling, which eventually formed the basis of AutoCAD. In 1987, Rockwell Automation was purchased by Autodesk, and AutoCAD became a division of Autodesk. Though it began as a desktop application, AutoCAD gained popularity as it was expanded to run on a wide variety of graphics cards, including hardware from IBM, Apple, Hewlett-Packard, TI, and 3dfx. AutoCAD became a popular tool for computer-aided design and drafting. The name AutoCAD was chosen because Dr. Reagan became involved in a highway construction project, and the letters A, O, and C are the initials of his last name. The initialism was based on the acronym ARINC (Automotive Industry). By 1992, the AutoCAD name became part of Autodesk's trade mark as Autodesk AutoCAD was introduced. This package included AutoCAD, an improved 3D graphics capability called 3D Studio, AutoCAD 2000 Plus (AutoCAD 2000 was just a restyled version of AutoCAD 9), a large number of AutoCAD add-on packages, and a suite of AutoCAD-compatible software tools. A few months later, after all of the software names had been refreshed, the software was renamed again. Instead of Autodesk, the new name was Autodesk 3D (now Autodesk 3ds Max) and AutoCAD remained the name of the software application. It is interesting to note that the name Autodesk originally stood for Automatic Design System, but in the late 1980s the term was expanded to include both modeling tools and AutoCAD. Autodesk used the term 3D in addition to AutoCAD because they perceived that some of their customers were confused as to which of the three products—3D Studio, 3D Max, and AutoCAD—was the most popular. Today, Autodesk 3D (now Autodesk 3ds Max) is the leader in 3D computer graphics. By 2005, Autodesk had more than 3,000 employees. Approximately

In this chapter, we describe a simple assay for the activation of phosphoinositide 3-kinase (PI3K) that utilizes U937 cells transfected with a reporter construct consisting of the DNA-binding domain of the GAL4 protein fused to the Gal4 transactivation domain and the SV40 TATA box element. For this assay, cells are plated on poly-D-lysine-coated 96-well plates and cotransfected with reporter and effector plasmids. Expression of a protein kinase will result in phosphorylation of the S-70 residue of the Gal4 transactivation domain and activation of the reporter. Transfected cells are treated with the test compounds for an appropriate period of time. These compounds include stimulatory or inhibitory agents for the activated protein kinase. Thus, the test for activation of PI3K is performed in a cell-based assay that requires no biochemical manipulations of cells and requires no radioactivity. In summary, the assay allows for rapid, quantitative, and sensitive testing of potential inhibitors of PI3K activity.Dispersion effects on a1d647c40b
